## Configuring Eclipse so it finds the image files and input files

Put the image files and input files in the root directory of your project, as shown in the figure below. Also, in Eclipse select *Run →*, and in the tab *Arguments* enter the name of the input file under *Program arguments*.

An alternative way to configure Eclipse is to first create a java project. Then, create a folder and place all your java, images, and input files in that folder. To run the program, select in Eclipse *Run → Run Configurations*, enter the name of the input file under *Program arguments* and, finally, under *Working directory* select *Other* and enter the path to the folder containing all your files as shown in the figure below.
